

Science of Knowledge

The understanding of understanding. Knowledge of what knowledge is and how it works. It could be described as reality itself becoming self aware. The processes of the pursuit of reality as it really is.

The Science of Knowledge is an understanding of our own brains. How the mind works both physically and mentally. The mind is who we are and the tool we use to perceive reality and to connect to other minds through language with which we share our knowledge and understanding. It is the science that allows us to comprehend the Tree of Knowledge itself. How do we know what we know? How do we know it is real? What is knowing? How does the individual interface into the collective mind? What is a collective mind and who controls it? These questions are examples of the realm of the Science of Knowledge.
