

Evolution is Real

As to evolution, evolution is science. We have the bones of creatures living millions of years ago that are the links between different forms of life. Bones exist that link us humans with our common ancestors that we share with other primates. In fact we have unearthed many civilizations that go back further than 10,000 years and predate Adam and Eve. And these discoveries actually exist and can be measured. We know them to be real.

Evolution is happening right now. Farmers have been using evolution for thousands of years to breed new and better farm animals and crops. The corn we eat today is very different than the corn that was raised by the ancient Egyptians. Today's cattle are very different from cows a few hundred years ago. The difference is that farmers controlled the breeding to select the best individuals and to cause them to reproduce instead of the inferior ones. We have taken control of evolution and used it to our benefit.

Do we know everything about evolution? No, we don't. But we know a great deal, and we're learning more every day. As we pursue science and research, we are expanding our knowledge of the reality of the universe and the world around us. This is real knowledge about the way that the world actually is. Knowledge that has come from scientific discovery rather than the mythology of past and primitive civilizations.
